TI - DENTAL CALCUS PREVENTING COMPOSITION

AB - PURPOSE: To obtain dental calculus-preventing composition having excellent dental calculus formation-preventing action and high safety even in continuous use for a long time containing casein phosphopeptide as an active ingredient.

- CONSTITUTION: Casein phosphopeptide used in an amount of ≥ 0.01 wt.%, preferably 0.1-5 wt.% to total of the composition and other well-known excipient, auxiliary, flavor, antibacterial agent or antiseptic agent, etc., are suitably mixed, then prepared to afford the objective composition. Said composition can be used in adding to dentifrice, mouth wash, a troche, a gargle, an ointment or chewing gum, etc. Casein phosphopeptide suppresses precipitation of calcium phosphate regarded as a cause of dental calculus formation, suppresses the transformation from amorphous calcium phosphate to hydroxyapatite and further effectively suppresses the crystal growth of hydroxyapatite.

AB - J04077415 Compsn. contains casein phosphopeptide as an active ingredient. Casein phosphopeptide is compounded in this compsn. at 0.01 wt.% or more, pref. 0.1-5 wt.%.

- USE/ADVANTAGE - This compsn. is compounded in toothpaste, mouthwash, troche, gargle, chewing gum, etc. This can prevent calcium phosphate from the precipitation and also prevent hydroxyapatite formation. This is quite safe on long-term usage.

- In an example, toothpaste contains calcium diphosphate (42 wt.%), glycerol (19 wt.%), carrageenan (1 wt.%), sodium lauryl sulphate (1 wt.%), saccharin (1 wt.%), casein phosphopeptide (0.5 wt.%), perfume (1 wt.%) and water. (Dwg.0/0)
